Sprint 3 - Individual Contribution Report

SOEN 341 | CareerConnect | Hirushi Rathnayaka | Fall 2026

1. Role and objectives

My Sprint 3 responsibilities were the Notifications frontend and the preparation of acceptance tests. The aim was to provide role-appropriate notifications for job seekers and recruiters and document testable requirements. Backend implementation was outside my assigned scope.

2. Work completed

Notifications frontend: I worked on the Notifications page, navigation links, role-based presentation, unread indicators and counts, mark-as-read controls, and empty/error states. Job seekers see application updates, interview invitations, and deadline reminders; recruiters see new-application alerts.
Integration preparation: I documented the expected Notifications API and used a clearly labeled demo mode while backend integration was unavailable.
Acceptance tests: I prepared and revised AT-25 through AT-31 covering notifications, analytics, recruiter posting management, and AI resume feedback. I preserved earlier tests, updated GitHub issues #154-#160, and expanded user story #6 to reflect all four notification types and access restrictions.

3. Validation and results

Check	Observed result
Job-seeker demo	Three appropriate notification types appeared; unread badge showed 2.
Recruiter demo	Only the recruiter alert appeared with recruiter navigation.
UI and code	Mark-as-read and empty state checked in demo; JavaScript syntax checks passed.
Acceptance tests	AT-25 to AT-31 documented and linked; real execution remains pending.

4. Issues identified and corrections

During testing, I found that recruiters initially saw job-seeker navigation and notifications. I reviewed the behavior and used Copilot assistance to correct the role-based display. I also strengthened acceptance tests for recipient ownership, duplicate/expired reminders, empty states, authorization, and processing errors rather than creating duplicate issues.

5. Use of AI tools

I used GitHub Copilot to assist with frontend implementation and revisions, and ChatGPT to support planning, acceptance-test review, troubleshooting, and GitHub workflows. I reviewed the generated changes and manually checked the interface; AI assistance did not replace my responsibility for the results.

6. Outstanding work and reflection

Frontend behavior was verified with sample data, not through a working Notifications backend. Backend integration, real recipient-authorization checks, and execution of AT-25 through AT-31 remain pending. This sprint reinforced the importance of distinguishing interface demos from end-to-end tests and aligning acceptance scenarios with user stories.
